Below, we provide six tables, four figures, and related captions that supplement the article entitled “A way to hydrothermal paroxysm, Colli Albani Volcano, Italy” published on the Geological Society of America Bulletin. We provide also the captions of four movies that show some exposures and sites of the study area. The movies are stored in this data repository along with this document.

## **Tables**

**Table DR2.** Samples, sampling sites, and laboratory analyses.

## Figures

**Figure DR1.** Photographs of alteration meso-structures from the Laurentina 1 to 4 (distal) outcrops. **(a)** Panoramic view (photomosaic) of the main exposure from the Laurentina 1 locality. **(b)** Zoned alteration within the Tufo Lionato ignimbrite (Laurentina 1). Note the draped upper edge of the altered area. **(c)** Zoned alteration within the Tufo Lionato ignimbrite (Laurentina 1). Note the mushroom-like structure with stem and domal cap, and the draped upper edge of the altered area. **(d)** Mushroom-like structures in the Tufo Lionato ignimbrite (Laurentina 1). Note that these structures root into the cap of underlying similar structures. **(e)** Subvertical stem of a mushroom-like structure developed along a visible fracture (Tufo Lionato, Laurentina 1). **(f)**, **(g)**, and **(h)** Subvertical and subhorizontal fractures surrounded by a halo of incipient alteration (Tufo Lionato, Laurentina 1). **(i)** Panoramic view (photomosaic) of the Laurentina 4 exposure. **(j)** and **(k)** Close-up views from the previous photograph showing the cloud-like alteration structure with upward fringes along the upper edge of the alteration cloud (Tufo Lionato, Laurentina 4). **(l)** Panoramic view (photomosaic) of the Laurentina 2 exposure. **(m)** Contact between the altered Tufo Lionato ignimbrite (above) and the altered paleosol (below) (Laurentina 2). Note that the Tufo Lionato is brecciated and the alteration structures (halos, zoning) are confined by the underlying paleosol. **(n)** Alteration structures within the Tufo Lionato, paleosol, and Pozzolane Nere (Laurentina 2). Note also, in this case, the confinement of these alteration structures within each unit. **(o)** Tufo Lionato ignimbrite altered and affected by a subhorizontal foliation fabric, which mainly consists of serrate and narrowly-spaced subhorizontal fractures accompanied by alteration and mineralization bands (Laurentina 3). **(p)** The subhorizontal foliation shown in (o) is, in places, undulated along subvertical bands (Laurentina 3). **(q)** Subvertical and steep fluid-conductive fractures (bordered by a red halo) cut across the subhorizontal foliation shown in previous photographs (Laurentina 3). At the upper tip of the fractures, subhorizontal mushroom-like alteration structures can form analogously to the Laurentina 1 exposures (see Figs. DR1a to DR1d). **(r)** Close-up view of the previous photograph (Laurentina 3). Small mushroom-like alteration structures can form from the domal cap of underlying mushroom-like structures.

**Figure DR2.** X-ray diffraction patterns for the unaltered Tufo Lionato from the Imater quarry (a) and the altered counterparts from the Laurentina outcrops (b-d). **(a)** unaltered Tufo Lionato; **(b)** Laurentina 1 outcrop; **(c)** Laurentina 2 outcrop; **(d)** Laurentina 4 outcrop. Keys: Ab: Albite; Anl: Analcime; Aug: Augite; Brt: Barite; Cbz: Chabazite; Gr: Greigite; Gt: Goethite; Hal-7: Halloysite-7Å; Hal-10: Halloysite-10Å; Jar: Jarosite; Lct: Leucite; Mrc: Marcasite; Ph: Phlogopite; Phl: Phillipsite; Py: Pyrite; and Qtz: Quartz.

**Figure DR3.** Results from the chemical mass balance analysis where, unlike Fig. 8, Sulfur is omitted to highlight other element gains and losses (Tables DR4 and DR6). **(a)** Pozzolanelle; **(b)-(f)** different alteration structures within the Tufo Lionato; **(g)** paleosol; **(h)** Pozzolane Nere. Numbers on the y-axis refer to a factor of loss (negative) or gain (positive) in mass (i.e., +1 stands for +100% of enrichment of the  $i$  component).  $\Delta M_i$  is the mass change in element  $i$ ,  $C_0^i$  is the original concentrations of the  $i$  component within the unaltered rocks.

**Figure DR4.** Color version of Fig. 9. Conceptual scenario of hydrothermal alteration progression eventually leading to the formation of a fluid barrier (caprock) and to consequent fluid overpressure, hydro-fracturing, and possible paroxysm in a progressive and cyclic fashion.

## Movies

**Movie DR1.** Movie showing an actively-degassing pond within the Zolforata di Pomezia area. This pond is visible also on Google Maps and it is located 600-700 m to the southwest of the red lake in the Zolforata di Pomezia former mine area.

**Movie DR2.** Movie showing an actively-degassing small pond within the Zolforata di Pomezia area, close to the pond shown in the Movie DR1.

**Movie DR3.** Movie showing a panoramic view within the the Zolforata di Pomezia former mine area. Note the S-rich mineralizations and connected hydrothermal alterations of the Tufo Lionato and Pozzolanelle ignimbrites.

**Movie DR4.** Movie showing the southern bank of the red lake within the Zolforata di Pomezia former mine area (Fig. 3). Note the Liesegang-like bands in the altered compact paleosol (Figs. 3i to 3k) and, above, the brecciated state of the altered Tufo Lionato ignimbrite (Figs. 3l to 3n).
