Note: Sample AX2922; UK national grid reference [NX2900 6997]. Zircons were mounted in 2.5 cm resin blocks and hand polished to expose their cores for analysis by using a ThermoElemental Axiom laser-ablation–multicollector–inductively coupled plasma–mass spectrometer (LA-MC-ICPMS) linked to a new Wave Research 266 nm nd:YAG laser-ablation system (see Foster *et al.*, 2002).

\*Beam intensity in volts.

† $^{206}\text{Pb}/^{238}\text{U}$  ratios corrected for instrumental mass bias and fractionation but not common Pb.

§Fully propagated error.

Notes: All analyses are zircon fractions picked from grains nonmagnetic at 1.8 A. Sample weights and hence U and Pb concentrations are approximate. Measured ratios are corrected for fractionation, common Pb, and spike. Corrections for fractionation, spike, laboratory blank, and initial common Pb used a single-stage Pb-growth model calculated at 1000 Ma (Stacey and Kramers, 1975). Correlation coefficients of  $^{207}\text{Pb}/^{235}\text{Pb}$  and  $^{206}\text{Pb}/^{238}\text{U}$  were calculated by using procedures and algorithms of (Ludwig, 1993); errors for measured ratios were propagated through data reduction and are stated at  $2\omega$  level.

\*Samples were single unweighed grains with concentrations based on an assumed weight of 1 mg.
