Note: All analyses were made using the University of South Carolina Cameca SX-50 using an acceleration voltage of 15 keV and a Faraday cup current of 40 nA. The following oxygen normalizations were used: 23 for tremolite and barroisite, 28 for chlorite, 5 for titanite, and 12.5 for clinozoisite. "b.d." indicates that element was below detection limits; "n/a" indicates that field does not apply.

[†]Calculated on the assumption that all Fe is ferrous.

[‡]Calculated on the assumption that all Fe is ferric.

[†]The "location" heading refers to the location where the analysis was collected: CT, California Institute of Technology; USC, University of South Carolina; USC silicate data is suspect in that the laser extraction line was plagued with problems due to contamination of the BrF₅ reagent by quantities of HF, which caused severe analytical difficulties.
